

# Measuring Elevation Change in Berry's Creek Marshes Using Surface Elevation Tables (SETs) and Marker Horizons Meadowlands Environmental Research Institute (Fall 2019)

The SET (Sediment Elevation Table) provides a constant plane in space from which the distance to the sediment surface can be measured by means of pins lowered to the marsh surface (USGS 2010). Benchmark rods were established, marker horizons of feldspar were emplaced, and baseline readings were taken at two locations in the Berry's Creek watershed, Eight Day Swamp and Walden Swamp, during the spring of 2009. Another site was added in the Tollgate Marsh area of Berry's Creek in the Fall of 2018 and measurements were taken in the following year the Fall of 2019. Each site will be revisited annually, and this report is a summary of those measurements.

**Figure 1: Study Area**

Walden Swamp

TollGate Marsh

Eight Day Swamp

At each site, three replicate plots have been installed. At each plot, nine pins are lowered to the marsh surface. Readings are taken in each of four orientations resulting in a total of 108 measurements. At the time of each subsequent reading, results obtained from each pin are compared. The average of the resulting differences becomes one data point that represents the level of the marsh surface. To obtain a yearly rate, this value is divided by the number of days that have elapsed between establishment of the benchmark and the subsequent reading. Time elapsed between readings is summarized in this report (Table 1).

**Table 1: Time Elapsed Between Readings**

Location	Initial Date	Subsequent Date	Days	Years
EDS -1, 2, 3	4/30/2009	10/22/2019	3827	10.5
WS -1, 2, 3	4/30/2009	10/2/2019	3807	10.4
TM -1, 2, 3	11/30/2018	10/1/2019	305	0.84

*Table 1 provides the dates for each reading and the time elapsed in days and years.*

Site	Marsh Type	Dominant Vegetation	Rate of Elevation Change (mm/yr)
Eight Day Swamp	High	Phragmites	8.17
Walden Swamp	High	Phragmites	11.75
Tollgate Marsh	High	Phragmites	-8.63

Tables 2 and 2a are summaries of the changes in elevation measured at each location.

Table 2 contains the averages of elevation changes obtained at each of the three plots (EDS-1, EDS-2, EDS-3 for Eight Day Swamp and WS-1, WS-2, WS-3 for Walden Swamp) as well as at each of the 4 orientation positions. The averages of measurements from all 108 platforms at each site are also included in Table 2. The average of all the platforms is then divided by the time elapsed since the initial date (Table 1) to derive the rate of elevation change in mm/yr (Table 2a). For the complete data set, please refer to Appendices at the end of this report.

**Table 3a: Feldspar Horizon Measurements – Fall 2019 sampling**

Site	Positive Accretion (Percent)	Accretion Rate (mm/yr)
Eight Day Swamp	100	6.45
Walden Swamp	100	5.45
Tollgate Marsh	33.3	2.0

*Tables 3 and 3a are summaries of the accretion measured by use of feldspar horizons emplaced at each benchmark location*

Feldspar horizons were emplaced inside three corners of each benchmark plot. The sediment between the white feldspar marker and the horizon is measured. One reading is taken at each of the three corners resulting in a total of nine values associated with each marsh; the average of all readings produces a summary value (Table 3a). Not all horizons produced recognizable accretion; it is possible that the feldspar cannot be found and will need to be replaced and a new data set generated. Where negligible material accumulated above the horizon, “NA accretion” is designated. All recoverable values are included in the calculation for accretion rate.

To obtain a yearly rate, this value is divided by the number of days that have elapsed between establishment of the benchmark and the subsequent reading. Approximately six years elapsed between the readings summarized in this report. Table 1 provides the dates for each reading and the time elapsed in days and years.

**Table 4: Elevation Rate and Accretion Rate – Fall 2019**

**Table 5: Marsh Processes (USGS 2010)**

SURFACE PROCESSES:
1) Sediment deposition
2) Sediment erosion
SUBSURFACE PROCESSES:
3) Root Growth
4) Decomposition
5) Porewater Flux
6) Compaction

*Table 5 explains both surface and subsurface interactions (USGS, 2010).*

## Discussion

While it is tempting to draw conclusions from this data set, one must acknowledge that marsh sediment processes take place slowly over long periods of time; to quote Jim Lynch, USGS SETs

methodology expert, "...It will take a long time to get enough data to see what's going on."(2010, personal communication)

Table 5 shows both surface and subsurface processes that can affect both the elevation and accretion rates. Elevation is affected by the surface and subsurface processes while the accretion is only affected by the surface processes.

Table 3a, Tollgate Marsh only had 1 plot to show positive accretion while the other plots still had the horizons at the surface. The horizons at Eight Day and Walden Swamp had 100 percent positive accretions.

According to table 4, the elevation rates for both Eight Day Swamp and Walden Swamp are keeping steady between 7 and 8 mm/yr and 11 and 12 mm/yr. The accretion rates remain constant between 5 and 6 mm/yr.

## Conclusion

Tollgate Marsh was installed in 2018 and only has 1 year of measurements, which makes it hard to draw any long-term conclusions. After 10 years of data from Eight Day and Walden Swamp we can start to draw conclusions about the increasing elevation rates and accretions rates. After 2015, the data levels out around 7.5 - 8 mm.yr for Eight Day and 11.5 - 12 mm/yr for Walden.
